

SPECIFICATIONS

1. How much bandwidth is required?

We recommend having a minimum download speed of 2Mbps available. However, there are other considerations that could impact downloading speed: frequency of usage and the number of users accessing our web applications concurrently within your school network.

2. Can my school network handle the additional traffic?

It depends on a variety of factors including, but not limited to, your available bandwidth, network usage and limits set by your network administrator. Please contact your IT department for further information.

3. What tools can help assess available bandwidth?

You can use a free online tool to help estimate your bandwidth usage by visiting the following website:

<http://bandwidthpool.com/bandwidth-calculator/>.

4. Can these web applications be accessed over both wired and wireless Internet connections?

Yes, however:

- We recommend using a desktop computer or laptop to access our web applications as we do not currently provide full support for all wireless devices.
- Due to the nature of our web applications, an Internet browser that supports Javascript and HTML/CSS is always required for access regardless of hardware platform.
